

Q. Choose one of your favorite websites and identify 5 different HTML elements used on the website. Make sure to include the URL in your submission.

The website I chose was YouTube. 5 different HTML elements I see are `<a>`, `<form>`, `<button>`, `<img>`, and `<input>`. `<a>` is used to send users to different links via hyperlinks using either an absolute path or relative path. `<form>` establishes a form for user input, which leads to `<input>`. `<input>` is used for users to put information. `<button>` is used to create a button for users click and will be determined what it does by JavaScript. `<img>` takes info and displays an image from the path that is created.

URL for the website I chose: <https://www.youtube.com/>

Q. What is your favorite thing you learned this week?

Favorite thing I learned this week was the `<img>` element on HTML. While I was creating my website for an assignment, as I did not learn much about coloring and designing yet, adding images and gifs from online made my website look more appealing. `<img>` can be applied in many social media apps by attaching hyperlinks to the images. I realized that I spent a lot of time decorating my website using `<img>`.
